```
*
```

```
**/
```

package section is collection of related classes and interface as single unit containing .class files

syntax- package p; package p1.p2;

first statement in java is package and cant have more than one package

import section to make the available classes and interfaces of a package in file to use it

syntax

import package name.*;

import package name.member name;

class section to represent the real world entities

main class section contains main method which is used to manage application logic defines flow and starting ending of app execution

Saving and compilation of java file

if our java file contains public (class,enum,interface)

then we must save file with public element name only

compiling

through CMD syntax javac filename.java

compiling many files at once

EMP.N.java

EMP A.java

STU A.java

STU E.java

*.java → compiles all files

EMP*.java → compiles files starting with the name EMP

A*.java → compiles all those files ending with A
